•  $\Gamma$  is a discrete subgroup of  $PSL(2, \mathbb{R})$ .

- $\Gamma$  is a discrete subgroup of PSL(2,  $\mathbb{R}$ ).
- Equip  $\Gamma \setminus \mathbb{H}$  with the usual hyperbolic metric.

- $\Gamma$  is a discrete subgroup of  $PSL(2, \mathbb{R})$ .
- Equip  $\Gamma \setminus \mathbb{H}$  with the usual hyperbolic metric.
- Geodesics on  $\Gamma \setminus \mathbb{H}$  are the images of hyperbolic geodesics in  $\mathbb{H}$ , i.e. vertical lines and semi-circles centred on the real axis.

- $\Gamma$  is a discrete subgroup of  $PSL(2, \mathbb{R})$ .
- Equip  $\Gamma \setminus \mathbb{H}$  with the usual hyperbolic metric.
- Geodesics on  $\Gamma \setminus \mathbb{H}$  are the images of hyperbolic geodesics in  $\mathbb{H}$ , i.e. vertical lines and semi-circles centred on the real axis.
- If γ ∈ Γ is primitive and hyperbolic, its *root geodesic* is the upper half plane geodesic connecting the two (real) roots.

- $\Gamma$  is a discrete subgroup of  $PSL(2, \mathbb{R})$ .
- Equip  $\Gamma \setminus \mathbb{H}$  with the usual hyperbolic metric.
- Geodesics on  $\Gamma \setminus \mathbb{H}$  are the images of hyperbolic geodesics in  $\mathbb{H}$ , i.e. vertical lines and semi-circles centred on the real axis.
- If γ ∈ Γ is primitive and hyperbolic, its *root geodesic* is the upper half plane geodesic connecting the two (real) roots.
- $\bullet$  This descends to a closed geodesic in  $\Gamma \backslash \mathbb{H},$  and all closed geodesics arise in this fashion.

• I am studying the *intersections* of pairs of closed geodesics.

- I am studying the *intersections* of pairs of closed geodesics.
- The discrete groups I consider are PSL(2, ℤ), and unit groups of Eichler orders in indefinite quaternion algebras over ℚ (i.e. Shimura curves).

- I am studying the *intersections* of pairs of closed geodesics.
- The discrete groups I consider are PSL(2, ℤ), and unit groups of Eichler orders in indefinite quaternion algebras over ℚ (i.e. Shimura curves).
- The case of Γ = PSL(2, ℤ) relates to the work of Duke, Imamoḡlu, and Tóth on linking numbers of modular knots in SL(2, ℝ)/SL(2, ℤ) ([DIT17]).

- I am studying the *intersections* of pairs of closed geodesics.
- The discrete groups I consider are PSL(2, Z), and unit groups of Eichler orders in indefinite quaternion algebras over Q (i.e. Shimura curves).
- The case of Γ = PSL(2, ℤ) relates to the work of Duke, Imamoḡlu, and Tóth on linking numbers of modular knots in SL(2, ℝ)/SL(2, ℤ) ([DIT17]).
- The Shimura curve case (conjecturally) relates to the work of Darmon and Vonk on real quadratic analogues of the *j*-function ([DV17]).

- I am studying the *intersections* of pairs of closed geodesics.
- The discrete groups I consider are PSL(2, Z), and unit groups of Eichler orders in indefinite quaternion algebras over Q (i.e. Shimura curves).
- The case of Γ = PSL(2, ℤ) relates to the work of Duke, Imamoḡlu, and Tóth on linking numbers of modular knots in SL(2, ℝ)/SL(2, ℤ) ([DIT17]).
- The Shimura curve case (conjecturally) relates to the work of Darmon and Vonk on real quadratic analogues of the *j*-function ([DV17]).
- There are lots of parallels to the work of Gross and Zagier on the factorization of the difference of *j*-values ([GZ85]).

# The setup for $PSL(2,\mathbb{Z})$

 Let q(x, y) be a primitive indefinite binary quadratic form (PIBQF), let γ<sub>q</sub> be its automorph, and let ℓ<sub>q</sub> be the geodesic connecting the roots of q.

# The setup for $\mathsf{PSL}(2,\mathbb{Z})$

- Let q(x, y) be a primitive indefinite binary quadratic form (PIBQF), let γ<sub>q</sub> be its automorph, and let ℓ<sub>q</sub> be the geodesic connecting the roots of q.
- This translates the inputs into pairs of PIBQFs, which come equipped with discriminants.

# The setup for $\mathsf{PSL}(2,\mathbb{Z})$

- Let q(x, y) be a primitive indefinite binary quadratic form (PIBQF), let γ<sub>q</sub> be its automorph, and let ℓ<sub>q</sub> be the geodesic connecting the roots of q.
- This translates the inputs into pairs of PIBQFs, which come equipped with discriminants.
- In fact, we can descend to equivalence classes of PIBQFs, since the root geodesic in  $\Gamma \setminus \mathbb{H}$  does not depend on the representative.

 Let B be an indefinite quaternion algebra over Q, O an Eichler order in B, and ι : B → Mat<sub>2</sub>(ℝ) an embedding.

- Let B be an indefinite quaternion algebra over Q, O an Eichler order in B, and ι : B → Mat<sub>2</sub>(R) an embedding.
- For D a discriminant, let O<sub>D</sub> be the unique quadratic order of discriminant D, lying in Q(√D). Let ε<sub>D</sub> be the fundamental unit of O<sub>D</sub>.

- Let B be an indefinite quaternion algebra over Q, O an Eichler order in B, and ι : B → Mat<sub>2</sub>(R) an embedding.
- For *D* a discriminant, let  $\mathcal{O}_D$  be the unique quadratic order of discriminant *D*, lying in  $\mathbb{Q}(\sqrt{D})$ . Let  $\epsilon_D$  be the fundamental unit of  $\mathcal{O}_D$ .

- Let B be an indefinite quaternion algebra over Q, O an Eichler order in B, and ι : B → Mat<sub>2</sub>(R) an embedding.
- For *D* a discriminant, let  $\mathcal{O}_D$  be the unique quadratic order of discriminant *D*, lying in  $\mathbb{Q}(\sqrt{D})$ . Let  $\epsilon_D$  be the fundamental unit of  $\mathcal{O}_D$ .
- An optimal embedding of  $\mathcal{O}_D$  into  $\mathbb{O}$  is a ring homomorphism  $\phi : \mathcal{O}_D \to \mathbb{O}$  that does not extend to an embedding of a larger order.
- Two optimal embeddings φ<sub>1</sub>, φ<sub>2</sub> are equivalent if there exists an r ∈ O of norm 1 with rφ<sub>1</sub>r<sup>-1</sup> = φ<sub>2</sub>.

- Let B be an indefinite quaternion algebra over Q, O an Eichler order in B, and ι : B → Mat<sub>2</sub>(R) an embedding.
- For *D* a discriminant, let  $\mathcal{O}_D$  be the unique quadratic order of discriminant *D*, lying in  $\mathbb{Q}(\sqrt{D})$ . Let  $\epsilon_D$  be the fundamental unit of  $\mathcal{O}_D$ .
- An optimal embedding of  $\mathcal{O}_D$  into  $\mathbb{O}$  is a ring homomorphism  $\phi : \mathcal{O}_D \to \mathbb{O}$  that does not extend to an embedding of a larger order.
- Two optimal embeddings φ<sub>1</sub>, φ<sub>2</sub> are equivalent if there exists an r ∈ O of norm 1 with rφ<sub>1</sub>r<sup>-1</sup> = φ<sub>2</sub>.
- Then  $\iota(\phi(\epsilon_D)) \in \Gamma$  is a hyperbolic element.

- Let B be an indefinite quaternion algebra over Q, O an Eichler order in B, and ι : B → Mat<sub>2</sub>(R) an embedding.
- For *D* a discriminant, let  $\mathcal{O}_D$  be the unique quadratic order of discriminant *D*, lying in  $\mathbb{Q}(\sqrt{D})$ . Let  $\epsilon_D$  be the fundamental unit of  $\mathcal{O}_D$ .
- An optimal embedding of  $\mathcal{O}_D$  into  $\mathbb{O}$  is a ring homomorphism  $\phi : \mathcal{O}_D \to \mathbb{O}$  that does not extend to an embedding of a larger order.
- Two optimal embeddings φ<sub>1</sub>, φ<sub>2</sub> are equivalent if there exists an r ∈ O of norm 1 with rφ<sub>1</sub>r<sup>-1</sup> = φ<sub>2</sub>.
- Then  $\iota(\phi(\epsilon_D)) \in \Gamma$  is a hyperbolic element.
- Thus we take the inputs to be pairs of (equivalence classes of) optimal embeddings, which again come equipped with discriminants.

• Write programs to compute intersection numbers, and study the output!

- Write programs to compute intersection numbers, and study the output!
- I chose to work with PARI/GP (other good options include Sage and Magma).

- Write programs to compute intersection numbers, and study the output!
- I chose to work with PARI/GP (other good options include Sage and Magma).
- PARI: a C library with an extensive amount of number theoretic tools.

- PARI: a C library with an extensive amount of number theoretic tools.
- GP: a scripting language that allows "on the go" access to the tools in PARI.
- Initially, I was working exclusively in GP.

#### Question

Given positive discriminants  $D_1$ ,  $D_2$ , which quaternion algebras admit optimal embeddings into a maximal order that have non-trivial intersections?

#### Question

Given positive discriminants  $D_1$ ,  $D_2$ , which quaternion algebras admit optimal embeddings into a maximal order that have non-trivial intersections?

• Ran a bunch of computations on quaternion algebras ramifying at {p, q}, and produced a finite list of such pairs for each pair of discriminants.

#### Question

Given positive discriminants  $D_1$ ,  $D_2$ , which quaternion algebras admit optimal embeddings into a maximal order that have non-trivial intersections?

- Ran a bunch of computations on quaternion algebras ramifying at {p, q}, and produced a finite list of such pairs for each pair of discriminants.
- Possible ramifying primes were always "small", and missing certain primes, even when the discriminants grew.

#### Question

Given positive discriminants  $D_1$ ,  $D_2$ , which quaternion algebras admit optimal embeddings into a maximal order that have non-trivial intersections?

• Turned this data into the conjecture

$$pq\mid \frac{D_1D_2-x^2}{4}$$

for some integer x with  $x \equiv D_1 D_2 \pmod{2}$  and  $|x| < \sqrt{D_1 D_2}$ .

#### Question

Given positive discriminants  $D_1$ ,  $D_2$ , which quaternion algebras admit optimal embeddings into a maximal order that have non-trivial intersections?

• Turned this data into the conjecture

$$pq\mid \frac{D_1D_2-x^2}{4}$$

for some integer x with  $x \equiv D_1 D_2 \pmod{2}$  and  $|x| < \sqrt{D_1 D_2}$ .

• This was later refined into a more precise necessary and sufficient condition, which was proven.

#### Question

Given positive discriminants  $D_1$ ,  $D_2$ , which quaternion algebras admit optimal embeddings into a maximal order that have non-trivial intersections?

• Turned this data into the conjecture

$$pq\mid \frac{D_1D_2-x^2}{4}$$

for some integer x with  $x \equiv D_1 D_2 \pmod{2}$  and  $|x| < \sqrt{D_1 D_2}$ .

- This was later refined into a more precise necessary and sufficient condition, which was proven.
- Computations were valuable to help verify the more precise conjecture in some of the messier cases.

• Darmon and Vonk ([DV17]) provided a recipe to produce a real quadratic analogue to  $j(\tau_1) - j(\tau_2)$  (lies in the correct ring class field, has a structured factorization).

- Darmon and Vonk ([DV17]) provided a recipe to produce a real quadratic analogue to  $j(\tau_1) j(\tau_2)$  (lies in the correct ring class field, has a structured factorization).
- The exponents of primes in the factorization should correspond to intersection numbers in a very concrete way.

- Darmon and Vonk ([DV17]) provided a recipe to produce a real quadratic analogue to  $j(\tau_1) j(\tau_2)$  (lies in the correct ring class field, has a structured factorization).
- The exponents of primes in the factorization should correspond to intersection numbers in a very concrete way.
- To test, I created a 587 page document detailing every "p-weighted" intersection number for  $D_1 = 5, 13$  and  $D_2 \le 1000$ . Compiling these computations took about a week.

- I am uploading the package to my Github (live version is 0.3): https://github.com/JamesRickards-Canada/Q-Quadratic

### Documentation excerpt

#### 3.1 Discriminant methods

These methods deal with discriminant operations that do not involve quadratic forms.

Name:	GEN disclist
Input:	GEN D1, GEN D2, int fund, GEN cop
Input format:	Integers D1, D2, fund=0, 1, cop an integer
Output format:	Vector
Description:	Returns the set of discriminants (non-square integers equivalent to $0,\ 1$ modulo 4) between $D1$ and $D2$ inclusive. If fund=1, only returns fundamental
	discriminants, and if $cop \neq 0$ , only returns discriminants coprime to $cop$ .

Name:	GEN discprimeindex
Input:	GEN D, GEN facs
Input format:	Discriminant D, facs=0 or the factorization of D (the output of Z_factor)
Output format:	Vector
Description:	Returns the set of primes $p$ for which $D/p^2$ is a discriminant.

Name:	GEN discprimeindex_typecheck
Input:	GEN D
Input format:	Discriminant D
Output format:	Vector
Description:	Checks that D is a discriminant, and returns discprimeindex(D, gen_0).

Name:	GEN fdisc
Input:	GEN D
Input format:	Discriminant D
Output format:	Integer
Description:	Returns the fundamental discriminant associated to D.

• Computing the *narrow* class group associated to a discriminant *D* in terms of BQFs (PARI/GP has implementations for the full class group, as well as the narrow class group for fundamental discriminants).

- Computing the *narrow* class group associated to a discriminant *D* in terms of BQFs (PARI/GP has implementations for the full class group, as well as the narrow class group for fundamental discriminants).
- Computing the Conway rivers associated to a PIBQF, as well as left/right neighbours of reduced forms.

- Computing the *narrow* class group associated to a discriminant *D* in terms of BQFs (PARI/GP has implementations for the full class group, as well as the narrow class group for fundamental discriminants).
- Computing the Conway rivers associated to a PIBQF, as well as left/right neighbours of reduced forms.
- Finding the general integer solution set to the equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey = n,$$

as well as the simultaneous equations

$$AX^2 + BY^2 + CZ^2 + DXY + EXZ + FYZ = n_1,$$
  $GX + HY + IZ = n_2.$ 

Initializing quaternion algebras, maximal orders, and doing all the basic operations.

- Initializing quaternion algebras, maximal orders, and doing all the basic operations.
- Computing all optimal embeddings, and sorting them by orientation and the class group action.

- Initializing quaternion algebras, maximal orders, and doing all the basic operations.
- Computing all optimal embeddings, and sorting them by orientation and the class group action.
- Compute the intersection number via "intersecting root geodesics", as well as "x-linking".
