## Maine-Quebec Number Theory Conference 2022 HAPPY BIRTHDAY ANDREW

## The Canonical Case

## Theorem (Bud Brown and Bruce Myers, 2002)

For a non-zero integer $m$, let

$$
E_{m}: y^{2}=x^{3}-x+m^{2} \text { and } P=(0, m), Q=(-1, m) .
$$

Then $P$ and $Q$ are independent points (of infinite order) on $E_{m}$, and hence

$$
\operatorname{rank}\left(E_{m}\right) \geq 2
$$

$E_{m}: y^{2}=x^{3}-x+m^{2}$,
$P=(0, m), Q=(-1, m), P+Q=(1,-m)$

## Proof.

(i.) There is no rational 2-torsion on $E_{m} \cdot\left(y \neq 0\right.$ on $\left.E_{m}\right)$
(ii.) None of $P, Q, P+Q$ are in $2 E_{m}$. (slightly tedious)
(iii.) $\{[O],[P],[Q],[P+Q]\}$ is a group of order 4 in $E_{m} / 2 E_{m}$. (ii.)
(iv.) $k, I \in \mathbb{Z}$ (not both 0 ) with $k P+I Q=O$ violates (iii.) if $k, l$ are not both even and violate (i.) if $k, l$ are both even.

## Other Results

- P. Tadic (2012)- generic rank (function field)

$$
E_{m}: y^{2}=x^{3}-x+m^{2}, m=m(t): \operatorname{rank}_{\mathbb{Q}(t)} E_{m(t)} \geq 2
$$

- Fujita and Nara (2017)
$E_{m, n}: y^{2}=x^{3}-m^{2} x+n^{2}: \operatorname{rank} E_{m, n} \geq 2$.
- Rout and Juyal (2021)
$E_{m}: y^{2}=x^{3}-m^{2} x+m^{2}: \operatorname{rank} E_{m} \geq 2$.
- Hatley and Stack (2021)
$E_{m}: y^{2}=x^{3}-x+m^{6}: \operatorname{rank} E_{m} \geq 3$.

## Other Polynomials

What about

$$
f(x)=(x-a)(x-b)(x-c)
$$

with distinct integers $a, b, c$ ?

$$
E_{(a, b, c), m}: y^{2}=f(x)+m^{2}
$$

## Other Polynomials

What about

$$
f(x)=(x-a)(x-b)(x-c)
$$

with distinct integers $a, b, c$ ?

$$
E_{(a, b, c), m}: y^{2}=f(x)+m^{2}
$$

Example: $(a, b, c)=(5,7,11), m=42$.

$$
E: y^{2}=x^{3}-23 x^{2}+167 x+1379
$$

$\operatorname{rank}(E)=2$ and
$E(\mathbb{Q})=<P, Q>$ with $P=(5,-42), Q=(7,-42)$.

## Beware: Rank 1 Examples Do Exist

```
R<x>:=PolynomialRing(Integers());
f:=(x-Random(10^2))*(x-Random(10^2))*(x-Random(10^2)); f;
for is in [1..32] do
f1:=f+i^2;
if IsSquarefree(f1) then
E:=EllipticCurve(f1);
SetClassGroupBounds("GRH");
[i,Rank(E)];
end if;
end for;
```

```

[ 12, 1]
[13, 2 ]
```

## Rank One Example

$$
E: y^{2}=(x-92)(x-87)(x-63)+12^{2}
$$

$$
E(\mathbb{Q})=\langle P\rangle, P=(87,-12)
$$

$$
E: y^{2}=(x-92)(x-87)(x-63)+12^{2}
$$

$$
E(\mathbb{Q})=\langle P\rangle, P=(87,-12)
$$

$$
\begin{aligned}
& 2 P=(93,-18) \\
& 3 P=(63,-12) \\
& 4 P=(92,-12) \\
& 5 P=(93,-18) \\
& 6 P=\left(2151 / 5^{2}, 2076 / 5^{3}\right) \\
& 7 P=(957,25938)
\end{aligned}
$$

## An Independence CRITERION

## Lemma

Let $a, b, c$ be distinct integers and $m$ a non-zero integer for which

$$
f(x)=(x-a)(x-b)(x-c)+m^{2}
$$

is squarefree. Let $P=(a, m), Q=(b, m)$ on

$$
E: y^{2}=f(x)
$$

## An Independence Criterion

## Lemma

Let $a, b, c$ be distinct integers and $m$ a non-zero integer for which

$$
f(x)=(x-a)(x-b)(x-c)+m^{2}
$$

is squarefree. Let $P=(a, m), Q=(b, m)$ on

$$
E: y^{2}=f(x)
$$

If
i. $E(\mathbb{Q})$ is 2-torsion free,
ii. $P, Q$ are points of infinite order, and
iii. $P, Q$ and $P+Q$ are not in $2 E(\mathbb{Q})$,
then $P$ and $Q$ are independent.

## Main Theorem

Theorem (W. 2022)
Let $a, b, c$ denote three distinct integers. There is an effectively computable constant $C=C(a, b, c)>0$ with the property that if $m>C$ then the rank of the curve $E=E_{(a, b, c), m}$, given by

$$
y^{2}=(x-a)(x-b)(x-c)+m^{2},
$$

is at least 2.
Strategy of the proof:
i. The curve has no rational 2 -torsion.
ii. $(a, m)$ and $(b, m)$ are points of infinite order.
iii. $(a, m),(b, m)$ and $(a, m)+(b, m)$ are not in $2 E(\mathbb{Q})$.

## Proof of the Main Theorem

## Simplifications

1. The translation $x \rightarrow x+c$ allows us to assume that $c=0$.
2. Put

$$
\begin{aligned}
& A=-27\left(a^{2}-a b+b^{2}\right) \\
& B=3^{6} m^{2}+27(a+b)^{3}+3 A(a+b) \\
& X=9 x-3(a+b), \quad Y=27 y
\end{aligned}
$$

then

$$
Y^{2}=X^{3}+A X+B
$$

## Proof of the Main Theorem

## Step One: 2-torsion

Assume that $(r, s)$ is a rational point of order two on $Y^{2}=X^{3}+A X+B$. Then $s=0$ and $r$ is a root, so that

$$
X^{3}+A X+B=(X-r)\left(X^{2}+r X+t\right)
$$

for some integer $t$.
$(*)(27 m)^{2}=(-r)^{3}+(-r)-3 A(a+b)-27(a+b)^{3}$.

Thus, $m<C_{1}=C_{1}(a, b)$ by Baker's Theorem.
(the cubic above never has multiple roots)

## Lutz-Nagell

Let $E$ be an elliptic curve given by

$$
y^{2}=x^{3}+A x+B, \quad A, B \in \mathbb{Z} .
$$

If $P$ is a non-zero torsion point, then
i. $x(P), y(P) \in \mathbb{Z}$.
ii. Either $2 P=0$ or $y(P)^{2}$ divides $4 A^{3}+27 B^{2}$.
$P=\phi((a, m))$ (mapped to the short model) is torsion, and $2 P$ is also. So $2 P \in E(\mathbb{Z})$ by Lutz-Nagell, and $\lambda \in \mathbb{Z}$.

The quantity $\lambda$ arising in the doubling formula is precisely

$$
\lambda=\frac{a(a-b)}{54 m},
$$

and is not integral for $m>C_{2}(a, b)$ (and note that $\lambda \neq 0$ ).

It remains to show that $P=(a, m), Q=(b, m)$,
$P+Q=(0,-m)$ are all not in $2 E(\mathbb{Q})$ for $m$ large.
Assume that $2(x, y)=(0,-m)$, need to show that $m$ is bounded.

$$
\lambda=\frac{3 x^{2}-2(a+b) x+a b}{2 y}, \nu=\frac{-x^{3}+a b x+2 m^{2}}{2 y} .
$$

The coordinates $(r, s)$ of $2(x, y)$ are given by

$$
\left(\lambda^{2}+a_{1} \lambda-a_{2}-2 x,-\left(\lambda+a_{1}\right) r-\nu-a_{3}\right)
$$

Since $(r, s)=(0,-m)$, and $a_{3}=0$, it follows that $\nu=m$.

Combining the two expressions for $\nu$ and simplifying gives

$$
x^{4}-2 a b x^{2}-8 m^{2} x+\left(a^{2} b^{2}+4 m^{2}(a+b)\right)=0 .
$$

The above polynomial in $x, m$ satisfies the hypotheses of Runge's Theorem on Diophantine equations, from which it follows that $m<C_{3}=C_{3}(a, b)$.

Combining the two expressions for $\nu$ and simplifying gives

$$
x^{4}-2 a b x^{2}-8 m^{2} x+\left(a^{2} b^{2}+4 m^{2}(a+b)\right)=0 .
$$

The above polynomial in $x, m$ satisfies the hypotheses of Runge's Theorem on Diophantine equations, from which it follows that $m<C_{3}=C_{3}(a, b)$.
$i$. The weighted sum of highest order terms is reducible.
ii. The polynomial is irreducible in $\mathbb{Q}[x]$ for $m>C_{4}(a, b)$.

Combining the two expressions for $\nu$ and simplifying gives

$$
x^{4}-2 a b x^{2}-8 m^{2} x+\left(a^{2} b^{2}+4 m^{2}(a+b)\right)=0 .
$$

The above polynomial in $x, m$ satisfies the hypotheses of
Runge's Theorem on Diophantine equations, from which it follows that $m<C_{3}=C_{3}(a, b)$.
$i$. The weighted sum of highest order terms is reducible.
ii. The polynomial is irreducible in $\mathbb{Q}[x]$ for $m>C_{4}(a, b)$.

## Open Problem:

Compare the explicit constants arising from both the Diophantine method and the Shioda/Silverman method.

## Using Pell Equations to get rank $\geq 3$

Theorem (W. 2023 - work in progress)
Let $a, b$ be non-zero distinct integers for which the Pell equation

$$
X^{2}-(a+b) Y^{2}=-a b
$$

is solvable in integers $(X, Y)=(n, m)$.
Then, for $m>C=C(a, b)$, the curve

$$
E: y^{2}=x(x+a)(x+b)+m^{6}
$$

has rank at least 3.
Proof: $P=\left(-a, m^{3}\right), Q=\left(-b, m^{3}\right), R=\left(-m^{2}, X m\right)$ are independent for $m>C$.

## Using Pell Equations to get rank $\geq 3$

Example $X^{2}-3 Y^{2}=-2, \quad(a, b)=(1,2)$

$$
X+Y \sqrt{3}=(1+\sqrt{3})(2+\sqrt{3})^{k}, \quad k \in \mathbb{Z}
$$

## Using Pell Equations to get rank $\geq 3$

Example $X^{2}-3 Y^{2}=-2, \quad(a, b)=(1,2)$

$$
\begin{gathered}
X+Y \sqrt{3}=(1+\sqrt{3})(2+\sqrt{3})^{k}, \quad k \in \mathbb{Z} \\
k=0, Y=1: E: y^{2}=x^{3}+3 x^{2}+2 x+1, \operatorname{rank}(E)=1
\end{gathered}
$$

## Using Pell Equations to get rank $\geq 3$

Example $X^{2}-3 Y^{2}=-2, \quad(a, b)=(1,2)$

$$
X+Y \sqrt{3}=(1+\sqrt{3})(2+\sqrt{3})^{k}, \quad k \in \mathbb{Z}
$$

$k=0, Y=1: E: y^{2}=x^{3}+3 x^{2}+2 x+1, \operatorname{rank}(E)=1$
$k=1, Y=3: E: y^{2}=x^{3}+3 x^{2}+2 x+3^{6}, \operatorname{rank}(E)=4$

## Using Pell Equations to get rank $\geq 3$

Example $X^{2}-3 Y^{2}=-2, \quad(a, b)=(1,2)$

$$
X+Y \sqrt{3}=(1+\sqrt{3})(2+\sqrt{3})^{k}, \quad k \in \mathbb{Z}
$$

$k=0, Y=1: E: y^{2}=x^{3}+3 x^{2}+2 x+1, \operatorname{rank}(E)=1$
$k=1, Y=3: E: y^{2}=x^{3}+3 x^{2}+2 x+3^{6}, \operatorname{rank}(E)=4$
$k=2, Y=11: E: y^{2}=x^{3}+3 x^{2}+2 x+11^{6}, \operatorname{rank}(E)=5$

## Using Pell Equations to get rank $\geq 3$

Example $X^{2}-3 Y^{2}=-2, \quad(a, b)=(1,2)$

$$
X+Y \sqrt{3}=(1+\sqrt{3})(2+\sqrt{3})^{k}, \quad k \in \mathbb{Z}
$$

$k=0, Y=1: E: y^{2}=x^{3}+3 x^{2}+2 x+1, \operatorname{rank}(E)=1$
$k=1, Y=3: E: y^{2}=x^{3}+3 x^{2}+2 x+3^{6}, \operatorname{rank}(E)=4$
$k=2, Y=11: E: y^{2}=x^{3}+3 x^{2}+2 x+11^{6}, \operatorname{rank}(E)=5$
$k=3, Y=41: E: y^{2}=x^{3}+3 x^{2}+2 x+41^{6}, \operatorname{rank}(E)=7$

## Using Pell Equations to get rank $\geq 3$

Example Let $a=1$ so the Pell equation becomes

$$
X^{2}-(b+1) Y^{2}=-b
$$

(which is always solvable with $X=Y=1$ ), and restrict to $b=t^{2}-2$ so that small units of positive norm exist.

$$
\left(1+\sqrt{t^{2}-1}\right) \cdot\left(t+\sqrt{t^{2}-1}\right)=t^{2}+t-1+(t+1) \sqrt{t^{2}-1}
$$

so $(X, Y)=\left(t^{2}+t-1, t+1\right)$ is also solution to the Pell equation.

$$
\begin{gathered}
E_{1}(t): y^{2}=x(x+1)\left(x+t^{2}-2\right)+1 \\
E_{2}(t): y^{2}=x(x+1)\left(x+t^{2}-2\right)+(t+1)^{6}
\end{gathered}
$$

should have (somewhat) large rank.

## Using Pell Equations to get rank $\geq 3$

## Current Record Holder

$$
E_{2}(346): y^{2}=x(x+1)\left(x+346^{2}-2\right)+347^{6}
$$

has rank 8.

$$
\begin{gathered}
E: y^{2}=x^{3}+(a+b) x^{2}+a b x+m^{6}, \\
P=\left(-a, m^{3}\right), Q=\left(-b, m^{3}\right), R\left(-m^{2}, m n\right),
\end{gathered}
$$

Need to show $R, P+R, Q+R, P+Q+R \notin 2 E(\mathbb{Q})$.

$$
\begin{gathered}
E: y^{2}=x^{3}+(a+b) x^{2}+a b x+m^{6}, \\
P=\left(-a, m^{3}\right), Q=\left(-b, m^{3}\right), R\left(-m^{2}, m n\right),
\end{gathered}
$$

Need to show $R, P+R, Q+R, P+Q+R \notin 2 E(\mathbb{Q})$.
$X(R)=-m^{2} \neq X(2(x, y))$ for $m$ large means showing that
$x^{4}+4 m^{2} x^{3}+\left(4(a+b) m^{2}-2 a b\right) x^{2}+\left(4 a b m^{2}-8 m^{6}\right) x$ $+\left(a^{2} b^{2}+4 m^{8}-4(a+b) m^{6}\right)=0$
has no solutions $x$ for $m$ large.

## It's LIKE MAGIC

Runge's Method: weighted sum of highest order terms
Is $x^{4}+4 m^{2} x^{3}-8 m^{6} x+4 m^{8}$ reducible?

## It's LIKE MAGIC

Runge's Method: weighted sum of highest order terms
Is $x^{4}+4 m^{2} x^{3}-8 m^{6} x+4 m^{8}$ reducible?
$x^{4}+4 m^{2} x^{3}-8 m^{6} x+4 m^{8}=\left(x^{2}+2 x m^{2}-2 m^{4}\right)^{2}$.

## $P+R, Q+R, P+Q+R \notin 2 E(\mathbb{Z})$
